Review of: "ColonNet: A Hybrid of DenseNet121 and U-Net Model for Detection and Segmentation of GI Bleeding"

Ravi Kumar¹

1. Independent researcher

1. More literature review needs to be done.
2. Dataset description needs to be elaborated, such as adding samples (images) for Test datasets.
3. Methodology needs to be explained clearly and completely. Explain in detail the proposed hybrid model with its importance. The paper does not sufficiently explain why combining these three tasks (Classification, Detection, and Segmentation) is necessary and how this combination improves upon existing methods.
4. Studies need to be compared with existing State of the Art work for classification and segmentation tasks.
5. Detailed Results need to be presented. The article needs more elaboration of results in the Discussion section with interpretation and justification of results.
