

# Review of: "Determinant of Vaccination Status among Children Under Five years in Mattu Town, Oromia Regional State, Ethiopia"

Frans Yosep Sitepu

Potential competing interests: No potential competing interests to declare.

1. It is quite a long time to publish, since the study was conducted in 2012 (more than 10 years ago).
2. Authors did not state the magnitude of the vaccination problem and the vaccine-preventable diseases problem in the study area (Mettu town).
3. It should be added to the background section to determine the vaccination status in the area. There is inconsistent information regarding the study period: in the abstract, "The research was conducted in Ethiopia (2012)," but in the Material and Methods section, "A community-based cross-sectional study design was used to collect 118 samples from January 2020 to March 2020." Need to clarify this statement.
4. What were the inclusion and exclusion criteria?
5. Since the data was analyzed using SPSS, do the authors have a license for the software?
6. In the Methods section, we need to determine what the definition of vaccination status is. Complete and incomplete?
7. The Discussion section is too short. Authors should add some information regarding vaccination and related risk factors, especially in the country.
8. In the conclusion section, there is no need to retype the results.
