

# Review of: "Exploring the Impact of Future Land Uses on Flood Risks and Ecosystem Services, With Limited Data: Coupling a Cellular Automata Markov (CAM) Model, With Hydraulic and Spatial Valuation Models"

Roxana Țîncu

Potential competing interests: No potential competing interests to declare.

The topic of this manuscript is very interesting and essential for people because the knowledge of future land cover changes is crucial for better managing risk phenomena.

The manuscript has some fragile points that should be eliminated in order to be published successfully.

The introduction should contain the purpose and the objectives of the research clearly defined and the necessity of this study.

For maps, the limits of the surrounding areas or a recent satellite image should be used as background. Also, the maps shouldn't contain the word „legend”; this word must be replaced with what the map represents. A better resolution is recommended.

The methodology applied in this study should be synthesized by a flowchart.

The results and discussions section is too short, while the conclusions section is too broad. I think the discussion section should be presented more clearly and in more detail.
