Potential competing interests: No potential competing interests to declare.

The content of this review is very important from the point of view of processed vegetables, nutrients, health and well-being; however, I think that some adjustments have to be made in order to enhance the quality of this report as a whole.

In this sense, after reading, I left some considerations based on my perspective on what could be improved.

English must be reviewed throughout the document, and some words must be changed to more commonly scientific words to make the reading easier.

Table 1 must be more detailed and rewritten; insert more specific information based on references from the FDA or other regulatory organs;

The quality of Figure 1 must be improved.

Inform what "Gherkin pickling" and IP6 mean??

Inform what "Class A or C" means;

Item 3 (Pickle production), I think this section must be carefully rewritten for better understanding of the reader. It appears a little bit confused;

I suggest you to change the word "lessened";

Other considerations that I have observed have already been suggested by other authors.

Thank you for the invitation and good luck in your paper publication;
