This paper gives a detailed description of adverse events occurring in a population of more than 1000 patients receiving the Amplatzer Amulet Occluder. Although not randomized, it is a real life evaluation with interesting results. The main limitation is reported by the authors: as it is a Multicenter trial, discharge policies are not the same in all centers. However, it doesn't affect prolonged in-hospital stay but only short length stay.

Tables and figures are well presented.

Although the results were predictable, the main interest of the paper is the description of different outcomes of patients.

Therefore, this paper is an interesting report in this field.
